

IMPROVEMENT TO COLOUR CATHODE-RAY TUBES

ABSTRACT

5

Cathode-ray tube with a substantially flat front face, the colour selection mask of which is produced by stamping. The mask (9) has an active surface (19) surrounded by a full peripheral border (28) terminating in a skirt (17) substantially perpendicular to the active surface.

To rigidify the active surface in a direction parallel to the major axis, the mean radius of curvature R_{se} of the said active surface is greater than the mean radius of curvature R_{bp} of the peripheral border.
